I need the 4 other files names. Thanks for your help. I created a small script which: reads the file and writes all the text on a single line finds the end of the text and then writes a line break The result is not the right one. I am attaching a small snippet of my result. A: Let's see if this works for you: `text=open("Documento1.txt", "r").read()` with `open("Documento2.txt", "w")` as output: `for line in text.split(" "): if not line: continue`
`output.write(line) output.write(" ")` This code will read in the first file and then write the second file without any intervening blank lines. Note that you should either use a separator of `" \r "` instead of `" "` or read the files in and write them out in the same order. You can either do all of this in one call to the `open()` function: with `open("Documento1.txt", "r")` as input, `open("Documento2.txt", "w")` as output: `for line in input.read().split(" \r "): if not line: continue`
`output.write(line) output.write(" ")` or just read the first file and write it out and then do the same with the second file: with `open("Documento1.txt", "r")` as input: `for line in input.read(): if not line: continue` with `open("Documento2.txt", "w")` as output: `output.write(line) output.write(" ")` Effects 2d92ce491b
