It's common to hear about a new technology called SoC that will allow us to build a device that combines an ARM processor with more powerful processors such as x86 cores that enable more complex and high performance applications. The most frequent example is a smartphone with the CPU running Android, while the GPU runs Windows and graphics applications. Unlike SoC, which we have seen on smartphones and tablets, SoC for PCs is not a technology that is currently used on the market. There are however, some technical challenges that must

be overcome in order to make SoC a reality for the PC market. In this article I will describe some of the challenges of SoC, and discuss what we can expect from it. Performance Problems One of the key problems with SoC for PCs is performance, and the reason is simple: the CPU and GPU are usually built on different technologies that differ from one another. We will look at this in more detail later. Click to read more on our forum: The LAN, as with all things computing, requires a good cup of coffee to keep up with. Here are seven tales of authors who took the adage too far. 'I'm sitting on a LAN...' Robert Wiener's 1983 collection of technological science fiction stories was called I'm Sitting on a LAN. The internet may seem like a natural extension of what Wiener imagined, but he imagined it almost 40 years before it came into being. In one story, one of the characters references the internet but the internet had not yet been invented by Wiener. In another story, a character was horrified by what the internet would do to his marriage as his email played havoc with his wife's diary. Wiener had an uneasy relationship with technology. When he did something, it would usually end badly. Like the protagonist of one of his stories, he had a terrible accident while riding his bicycle. His bike ran out of gas and he fell, crashing into a truck. Wiener has a troubled relationship with computers, too. He wrote a lot of code and loved his computers, but he wanted more from them. At least, he wanted his computers to love him. Wiener invented a game in 1982 called NetLog. The idea of playing with remote computers was novel, but it was the first time anyone had conceived of a

PI MaxxPI 2.0 Multi is a high performance application that measures the performance of Intel(R) processors in real-time. You can configure up to 5 PCs per test and process files upto 2 GB in size. The process starts after you configure the program, and does not require installation. Your file is processed in parallel. Your results are saved as a log file that you can upload to the internet for comparison. The program is multi-threaded to process files much faster. You can even stop the process to work on other tasks. #4389Nagios Core Visitor Intervals #2 LogVis : Log data collection CoreVis Core Visitor Intervals is a Nagios plugin to collect, aggregate and graph a number of

performance metrics. Collected metrics can be logged into a file using file:// as a path. Usage of file:// is now recommended for logging. The plugin supports Nagios Core V3 and greater. It also supports MySQL/MariaDB and SQL Server, and any DB query that can be written in C or PHP. Nagios plugins can be enabled/disabled at any time, even after monitoring has started, and access to nagios.cfg can be restricted to certain Nagios users. It's a pluggable plugin, which means that it can be extended to support a number of DB interfaces. CoreVis is a Nagios plug-in that allows to monitor CPU usage of the last 5 seconds, and to collect the results in a SQL database. It is written in Perl and PHP, and requires only SQL to be installed. It does not require a Nagios Server. #2 #nagios# Nagios Core Visitor Intervals CoreVis Core Visitor Intervals is a Nagios plugin to collect, aggregate and graph a number of performance metrics.
