Graphic Design Certification The Graphic Design Certification program from the American National Standards Institute (ANSI) is designed to help designers and layout professionals prepare for the Graphic Design Technology examination. Designers who possess a solid understanding of the field of Graphic Design and design experience may enroll in the Graphic Design Certification program. Students who have previous Graphic Design experience may find this program to be a valuable addition to their educational background. ANSI GDT® The Graphic Design Technology program is designed to help professionals prepare for the Graphic Design Technology examination, which is administered by the American National Standards Institute (ANSI). The Graphic Design Technology examination is focused on a conceptual understanding of the field of Graphic Design. The exam is designed to evaluate the ability of candidates to communicate design ideas, draw and create communication and advertising projects and display them on a variety of media. The Graphic Design Technology program is composed of four courses: General Communications, Graphic Design, Website Design, and CAD/CAM. Each course consists of a reading/study assignment and a term project. The General Communications course focuses on the foundations of Graphic Design and the role of communication. The Graphic Design course examines the basic processes of creating and improving graphics. The Website Design course covers the different aspects of web design and the role of the designer in creating effective web pages. The CAD/CAM course covers the basic principles of CAD and CAM, and how those principles are applied to the production of various types of manufacturing products. In addition, the Graphic Design Technology program includes two term projects that allow the student to apply his or her concepts and skills. The term project provides students with the opportunity to synthesize their knowledge and skills in the subject matter. GDT Program Description The Graphic Design Technology program is composed of four courses: General Communications - This course focuses on the foundations of Graphic Design and the role of communication. The course is taught through a combination of lectures, discussions, assignments, and hands-on projects. Students will explore the key ideas and processes of graphic design, including the selection and development of design ideas, the use of appropriate tools and techniques, and the communication of ideas through multiple media. The course builds on the foundation of design courses in such fields as architecture, interior design, fashion, advertising, and interior and architectural illustration. It also provides students with a fundamental knowledge of such areas as mathematics and statistics, and their application to the field of Graphic Design. - This course focuses on the foundations of Graphic

Human-machine interface AutoCAD uses a graphical programming language for creating user interface. It is capable of creating visual UI from code in no time, and is also able to use keyboard shortcuts and mouse clicks for working with graphical UI. AutoCAD uses 3D-languages for defining objects in a model. The object can be 3D drawn for a particular layer using pencil, pen, or line-draw tools or be rotated, scaled, mirrored, flipped, and moved to any coordinate. Common drawing and task operations AutoCAD supports drafting and drafting tasks. Drawing and architecture AutoCAD (the most recent version is 2016) includes drafting and design capabilities. It provides design tools that simplify 2D drafting, such as the pencil tool, windowing tool, line drawing tools and the ability to rotate, mirror and scale objects. Design and drafting features are described in the user manual. The application is used primarily to design and edit floor plans and drawings. It can be used for architectural, engineering, industrial and landscape designs. AutoCAD 2016 supports parametric building design which includes the use of building information modeling (BIM) and 3D computer-aided design (CAD). It also includes the ability to import and generate 2D plans and drawings from 3D objects. AutoCAD Architecture is a commercial AutoCAD add-on and is a digital drafting application designed to create architectural and interior design drawings. It allows for the creation of architectural drawings and architectural designs of entire buildings or individual rooms. The drawing tools are similar to those found in standard AutoCAD drawings, but have additional tools for work on site and in a virtual environment. Additional tools are provided to design floors, walls, ceilings, elevations, and elevations. The software has many standard architectural features including a floor plan editor, a windows tool, and a door and window tool. Commercial packages include BIM360 Architecture which provides parametric modeling of architectural elements. It can also create site and interior environments for the design of a building using a virtual building environment. AutoCAD Architecture (the latest version is 2015) is a commercial package that provides parametric modeling of building elements and virtual environment construction. The object-oriented drawing and modeling features are powerful enough to model individual rooms or buildings, but can also model entire interior environments for the design of a building. AutoCAD Electrical provides an architectural package to design electrical systems. It can simulate electrical systems in both a1d647c40b
