Thus, the police only use informers that look trustworthy so that they don't expose their (the informer's) identity to the police. However, some people may trick the police into believing that they are trustworthy informers by doing activities that look suspicious to the police. In these cases, it is quite possible that the police will end up questioning or even arresting the informer. The informer will then have to spend time and effort trying to prove his/her innocence to the police, but will be unsuccessful.Evaluation of a new analytical algorithm for event-related potentials. Nonparametric tests are widely used to detect neural activity associated with specific brain functions. However, the elimination of the outliers in the distribution of amplitudes and latencies often compromises the statistical robustness and the psychophysiological interpretation of the data. An adequate algorithm to improve statistical robustness and to reduce the outliers is proposed. The algorithm is built on a three-steps procedure based on variance filters. Outliers are computed from the distribution of the samples that correspond to the 95th percentile (cut-off point) of the amplitude and latency values. The detection of outliers allows the elimination of the smallest amplitude and latency values that are less reliable. The response of the algorithm is evaluated in the case of event-related potentials recorded in response to an auditory tone-discrimination task. The effect of this procedure on the distribution of the amplitudes, latencies, and amplitude ratios is assessed using a 55cdc1ed1c
