================= Concrete Pressure test is a method of testing the strength of soil or rock-like material by imposing a thrust onto the soil or rock and then measuring how much the thrust force is reduced by. To make the test more thorough, a cone penetrometer can be used to determine the depth of penetration. A cone penetrometer has a cone-shaped tool. The cone penetrometer is then used to penetrate into the soil/rock like material. The most significant purpose of the test is to measure the Hardness value (Hv) or rock strength. Measurement of this value is very important, as it is needed to measure the maximum depth of penetration that the cone penetrometer is able to achieve in the soil. This means that the readings that will be obtained from this test can be easily comparable with the results of other tests. This is also a cost effective process. Smart It-T! ================= Smart It-T! is an application that requires no login or registration. This application is available on all Android platforms, devices, and operating systems (e.g., iOS) via the Google Play Store. The application contains all the necessary features and is user friendly. The app was designed to help you get a view of all the tools that you can use to measure the strength of materials. You can also use the app to plot and save measurement results as well. These features help you to save time and ensure the quality of your tests. Smart It-T! Features: =================== - A clear interface with a simple UI - The ability to analyze the results obtained - A detailed table of the results - A step-by-step tutorial - The ability to plot the results - The ability to save and export the results - The ability to rate each device - Use the app on multiple devices in parallel and on multiple threads -.jar file for penetration What does this app do? ====================== Where can I use it? ================== SoilPressure! In the picture below, you can see the soil pressure chart. The pressure chart describes the soil behavior class, i.e., the type of soil behavior. Each of the chart types has two different curves that show a sample line. This sample line represents the average pressure recorded during all penetrations, so it is the maximum expected pressure. If the curve is higher than this maximum

What's New in the CPeT-IT?

• Soil Behavior Type calculator - adds, subtracts, multiplies, divides the values in your CPT • Bulk Modulus calculator - calculates the bulk modulus, the plasticity index, the residual strength • T-quotient calculator - computes the cohesion, the internal friction, the angle of internal friction, the angle of surface tension • Contour charting and plotting - provides direct methods to plot and create contour charts • Force charts for CPTs - plot force vs. depth in CPTs • Graph of average pressures - shows average pressures at each soil depth • The image of this app only looks like it does for (literally) one moment and disappears the next. It contains binary data that may be from different years and it has that value in the top left corner which can be a pain at times. There is no manual process to convert the binary into text and there is no manual way to convert from text back to binary. If you don't get the results you expect it can be a huge headache. The camera does not save images and there is no way to save what was being seen through the camera to the phone. Apple refuses to let the App store sell any apps that record or transmit video/audio.
